

My report for "Cypress-e2e-Allure Automation-Framework with allure reports"

For site : <http://automationpractice.com/index.php>

First I visit that site manually, and check for performance. Site worked with some network issues, so I increased some timeouts in `*\cypressAllure\config\config.config.ts` Then I start to check this autotests

- 1) add `.should('have.attr', 'href')` in `signoutLink` in `myAccountPage.ts` line 11 (to check not only for text)
- 2) In login test you can write `it('_', ()=>{})` same as `it('_',function(){})`
- 3) Test "login with wrong email format credentials read data from fixture" had grammar error in `loginPage.validateLoginError('Invalid email adresssssss')` delete few of sss, to be like address
- 4) `myAccount.test.ts` have import but he is not focused. I uncommented line 6 to activate and comment line 5. This file don't contained any test, only visit to tested sit
- 5) Add command in `package.json` for Allure
